

Watch Out For External Security Threats Against Your Network

- Automate the mundane, tedious manual log analysis
- Exhaustive, canned reports for variety of security breach attempts
- To know who, when, where, and how of bandwidth usage
- Get notified of the anomalous and specific security events
- Out of the box support for Managed Service Providers

ManageEngine | Firewall Analyzer

Relax! Be aware of security threats and bandwidth usage!

The Network Security Challenge

CIO/IT Managers are worried about the wide variety of attempts to breach into their networks. Intrusions, viruses, and attacks are the security threats that make them sleepless. They need to keep a constant vigil on the security events happening at the network perimeter devices.

Next they are worried about the enterprise bandwidth usage during business hours particularly affecting business. For some of them, the internet bandwidth is expensive and for the rest of them the over usage clogs the connection affecting business. They require an automated, easy to setup and use solution to tackle the network security challenges.

Introducing Firewall Analyzer

Firewall Analyzer is a web based and agent-less application. It analyses logs from Firewalls and other network security devices and generates alert notifications, security, and bandwidth reports. The application empowers Administrators by providing comprehensive reports about the security events and in turn they can take steps to mitigate the security attempts.

Another important aspect of the application is the elaborate bandwidth reports, which allow the Administrators to take control of the bandwidth usage of the enterprise by pinpointing the particular user and the offending URLs visited.

“ With close to 70,000 membership-base, internet bandwidth usage is critical to the organization's function. I needed a product that is easy to setup, easy to use and affordable. Firewall Analyzer meets and surpasses all these requirements. ”

Lincoln A. Mason,
Network Administrator,
Information & Technology Services,
Professional Engineers Ontario

“This tool is very useful. If you have only few moments to have a look at your Firewall log, you can rapidly have an idea on what's happening to your network. With the complete message, you will rapidly find the source (Virus, Peer2peer, DNS mis-configuration or other parameter).”

Steve Balon,
Integrated Network Solutions

Monitor Network Security Events

- Instant one click reports for Security, Viruses, and Attacks
- Comprehensive VPN reports give out detailed statistics on VPN usage
- Spot the VPN Users in real-time

Monitor Bandwidth Usage

- Live reports enable real-time monitoring of bandwidth usage
- Exhaustive Traffic reports for finding out who is using the bandwidth, how much, when, and what sites are being accessed
- Traffic Trend reports makes your job, of capacity planning and Internet bandwidth resource augmentation, easier
- Top talkers report will list the maximum bandwidth user through the proxy server
- Website details report lists the complete details of the web sites visited by the user through the proxy server

System Requirements

Pentium IV 1.8 GHz, 512 MB RAM on Windows 2000, XP, 2003 & Vista and Linux all flavors. Browsers: IE & Firefox

Get Real time Alerts & Administer Alerts

- Email alert notifications for anomalous events and specific events
- Adopt any other alert notification mechanism using Run Program on alert generation
- Alert administration for resolving the security or bandwidth issues

Managed Security Service Provider (MSSP) Ready

- Profitable Managed Firewall Service for MSSPs
- Administrator assigned user-specific Firewall views access
- Separate access to each client to view only respective Firewall details
- Customizable dashboard views based on different geographical locations or customer's nature of business
- Alert administration for resolving issues (a simple ticketing functionality)
